monohybrid and dihybrid crosses were performed. The monohybrid fruit flies that were crossed possessed a wild-type phenotype for all traits, but were heterozygous for the sepia eye mutation, meaning their genotype was Ss for eye color. The parent generation of the monohybrid flies consisted of ...

Punnett Squares " Dihybrid Crosses Background Punnett Square are used to predict the possibility of different outcomes. When looking at one trait at a time it is called a monohybrid cross. You completed these last year. Complete the review problem below.

Punnett Squares – Dihybrid Crosses

A cross (or mating) between two organisms where two genes are studied is called a DIHYBRID cross. The genes are located on separate chromosomes, so the traits themselves are unrelated. Fill out the genotypes of each of the offspring to determine how many of each type of offspring are produced. BB = black

DIHYBRID CROSS Name - The Biology Corner

Monohybrid Cross and Test Cross Mendel's cross-hybridization studies involved purebred plants that differed with regard to a single contrasting trait. Purebred, homozygous, parental stocks were crossed and the offspring of this cross are called F 1 hybrids, or monohybrids.
